Consent Management. Secure Health Record Access, Doctor Verification

The screenshot shows a Jira interface for an Epic titled "Consent Management". The page is divided into several sections:

- Description:** Manage patient consent permissions for granting, viewing, and revoking time-bounded access to selected diagnostic records.
- Child work items:** Add child work item.
- Linked work items:** Add linked work item.
- Confluence content:** Project plan (with a "Try template" button).
- Activity:** A tabbed interface with "Comments", "History", "Work log", and "Approvals". The "Comments" tab is active, showing a comment input field and buttons for "Who is working on this...?", "Status update...", and "Thanks...".
- Details sidebar:** Contains fields for Assignee (Unassigned), Reporter (Rohan M), Labels (None), Due date (None), Start date (None), Sprint (PAD Sprint 1), and Priority (Medium).
- More fields:** Story Points, Original estimate, Time tracking, Components, Team, Fix v...
- Automation:** Rule executions.
- Atlassian project:** Link to share status and updates.

The page also includes a search bar at the top, a "Create" button, and a "See plans" button. The bottom of the page shows "Created 10 seconds ago" and a "Configure" button.

Secure Health Record Access

Description

Control clinic doctor access to patient diagnostic records based on the validity of patient consent.

Description

As a clinic administrator,
I want to manage the verification status of
clinic doctors,
so that only verified doctors can receive
authorized access to patient records.

Sprint 2 – Completion

Reflection Questions

1. Did your estimations reflect the actual effort?

The estimates generally reflected the relative complexity of the work. The larger stories, such as granting consent and accessing diagnostic records, were assigned 5 story points because they involve more validation and access-control logic. Smaller stories such as viewing the consent registry and managing doctor verification were assigned 3 points. Since this was a simulated sprint, the story-point estimates were mainly useful for comparing relative effort rather than measuring actual time.

2. Was your backlog well-prioritized?

Suggested answer:

Yes. The backlog prioritized core consent and health-record access functionality first because these functions are central to the system's purpose. Granting consent and accessing diagnostic records were given High priority, followed by revocation and expiry-related access control. Supporting functions such as viewing the consent registry and managing doctor verification were given Medium priority.

3. How did your simulated sprint align with your plan?

Sprint 1 focused on the core consent and record-access workflow and contained 16 story points. Sprint 2 completed the remaining consent visibility and doctor verification functionality with 6 story points. The stories were moved from To Do to In Progress and then Done to simulate the development workflow. Overall, the sprint structure followed the planned backlog prioritization.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart provided a visual representation of how quickly the planned story points were completed during the sprint. It helped compare actual progress with the ideal guideline and showed how the remaining work decreased as stories were completed. Since this was an individual simulated sprint rather than a real team project, the chart provides only a limited indication of capacity, but it demonstrates how Scrum teams can monitor progress and identify deviations from the plan.
